

An Introduction To Lipidomic Workflows

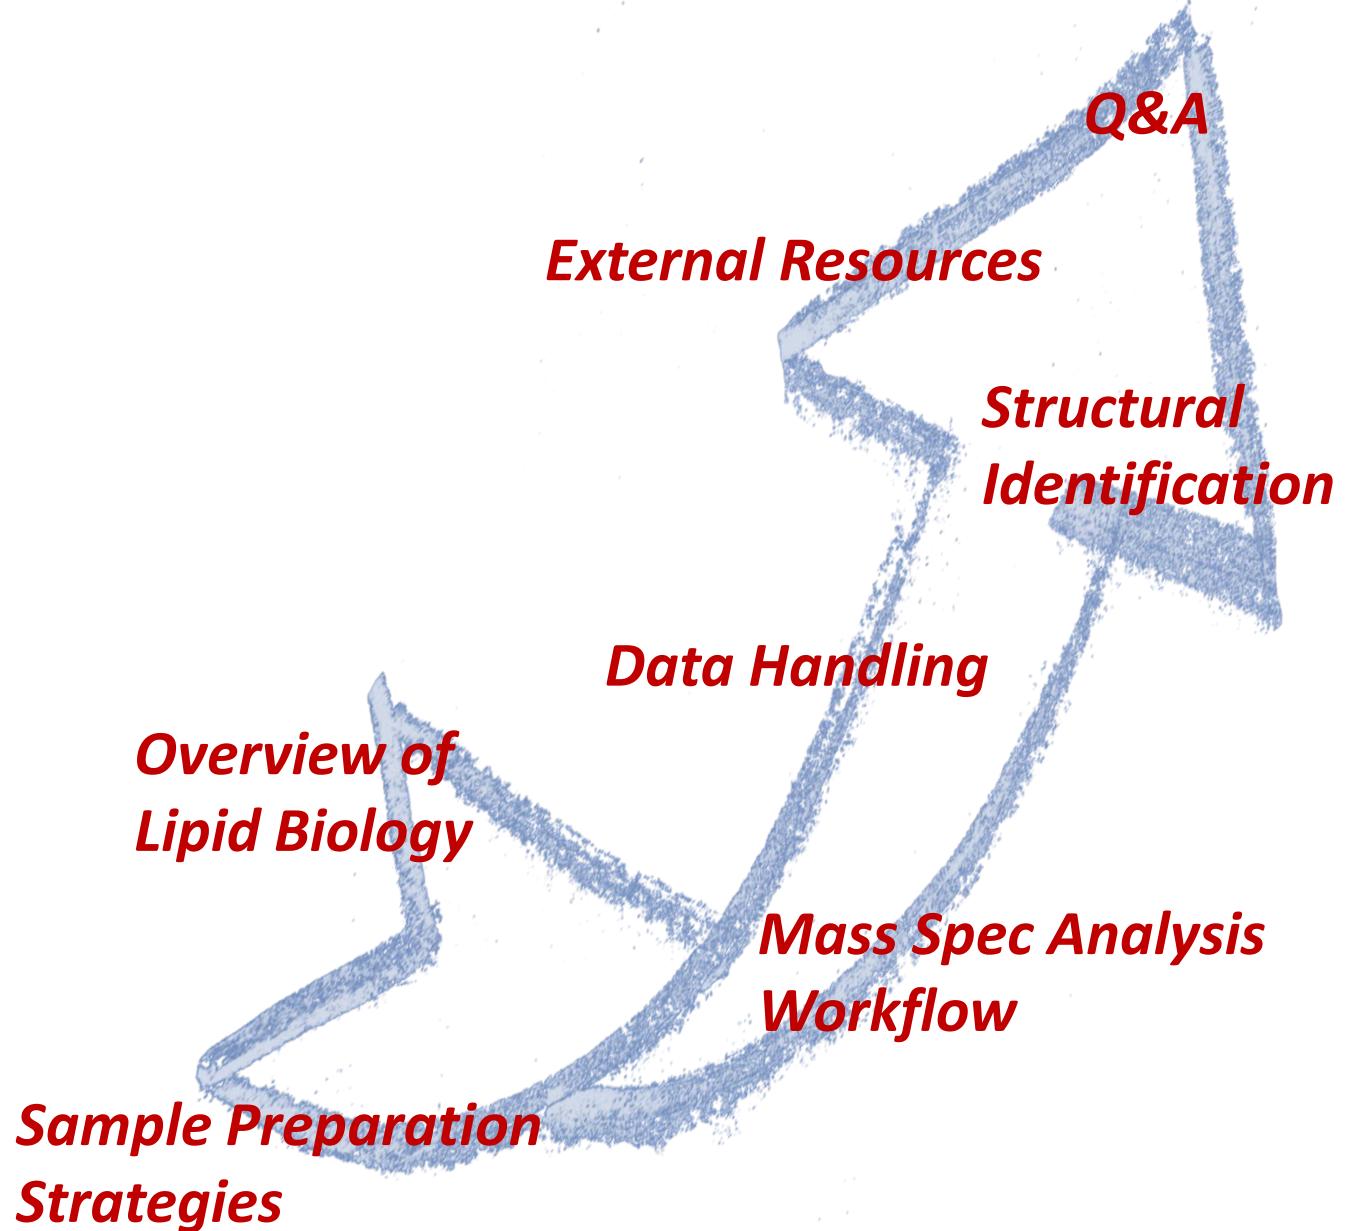

John Bowden (University of Florida)
Gavin E. Reid (University of Melbourne)
Valentina Pirro (Eli Lilly and Company)

Course Outline

- ❖ Introductory Level
- ❖ Goal is to provide information and resources on current workflows, from the experimental design stage to data dissemination, so that attendees can learn how to adequately design, perform, and analyze data from lipidomics experiments.
- ❖ Basic knowledge of analytical chemistry and mass spectrometry is required

Overview and Sample Prep

History of Lipidomics

Technological advancements

Applications

Internal Standard Addition

Lipid Extraction

Derivatization

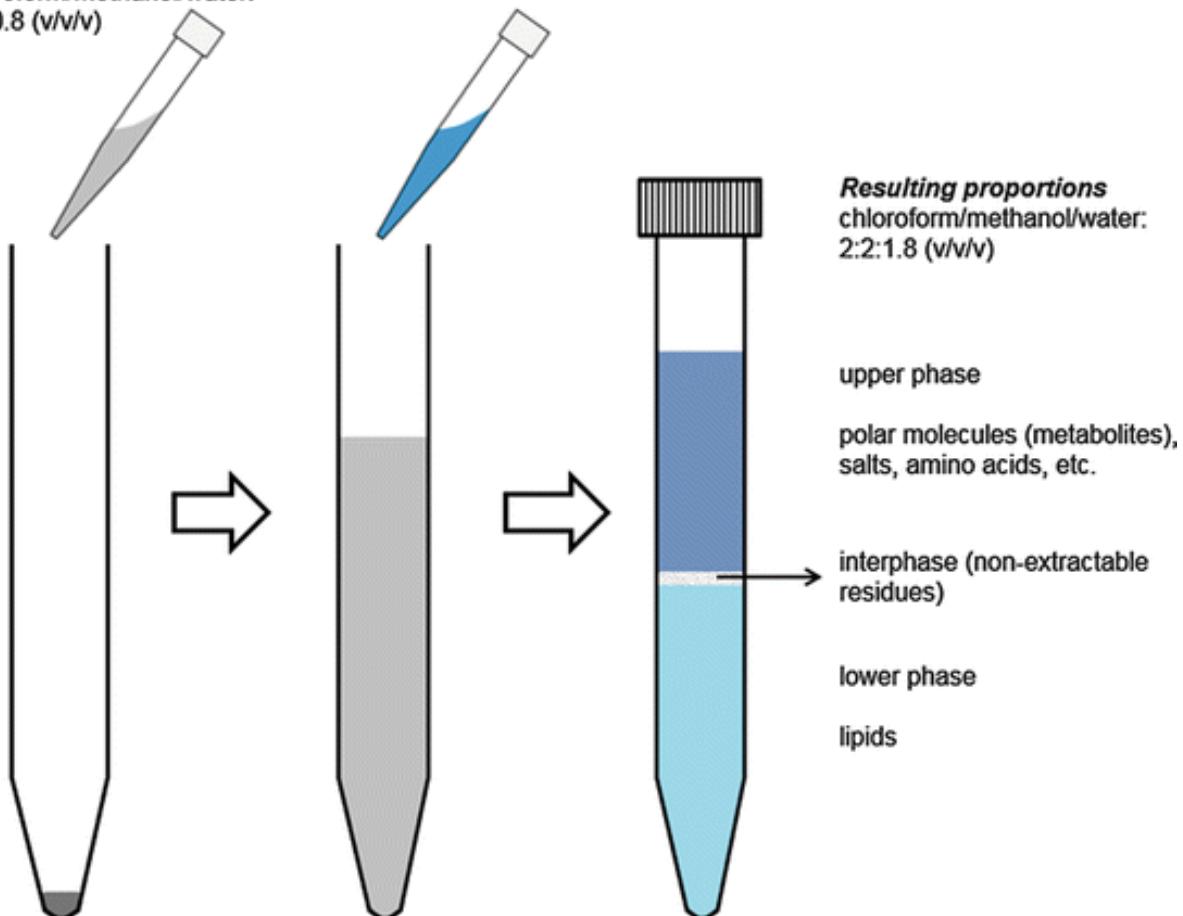

Stability

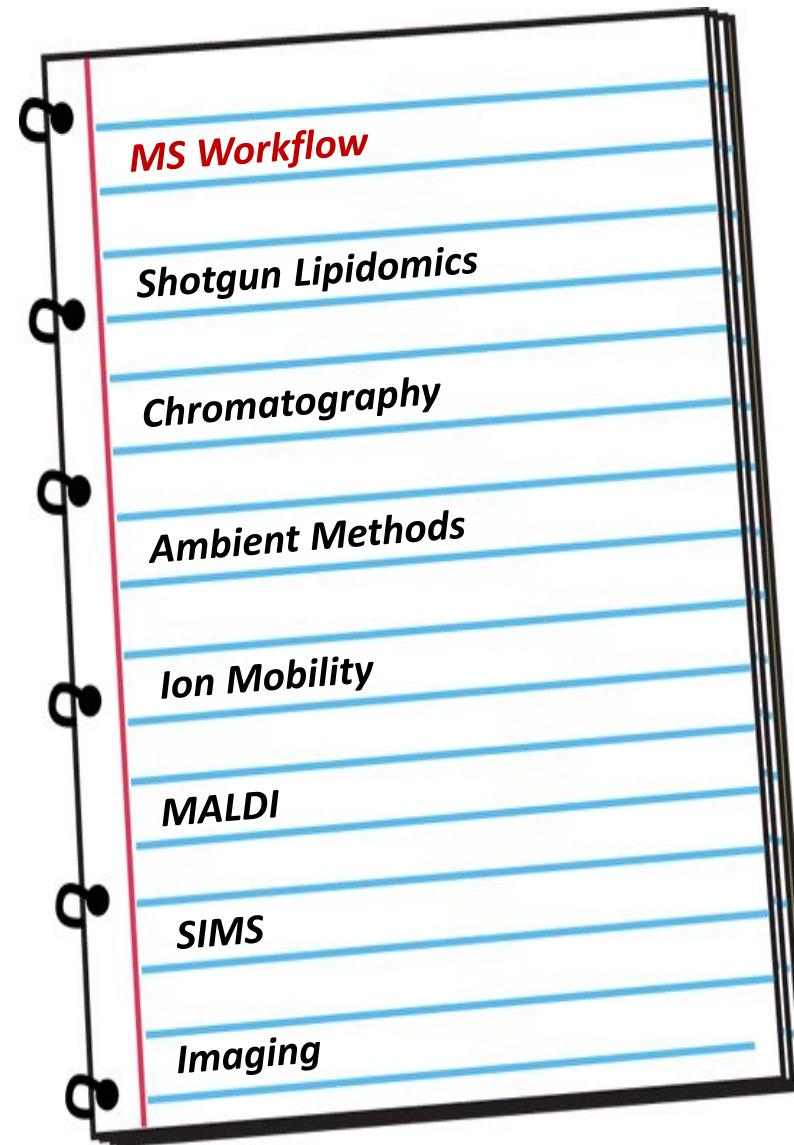

mix sample with
chloroform/methanol
1:2 (v/v)

Resulting proportions:
chloroform/methanol/water:
1:2:0.8 (v/v/v)

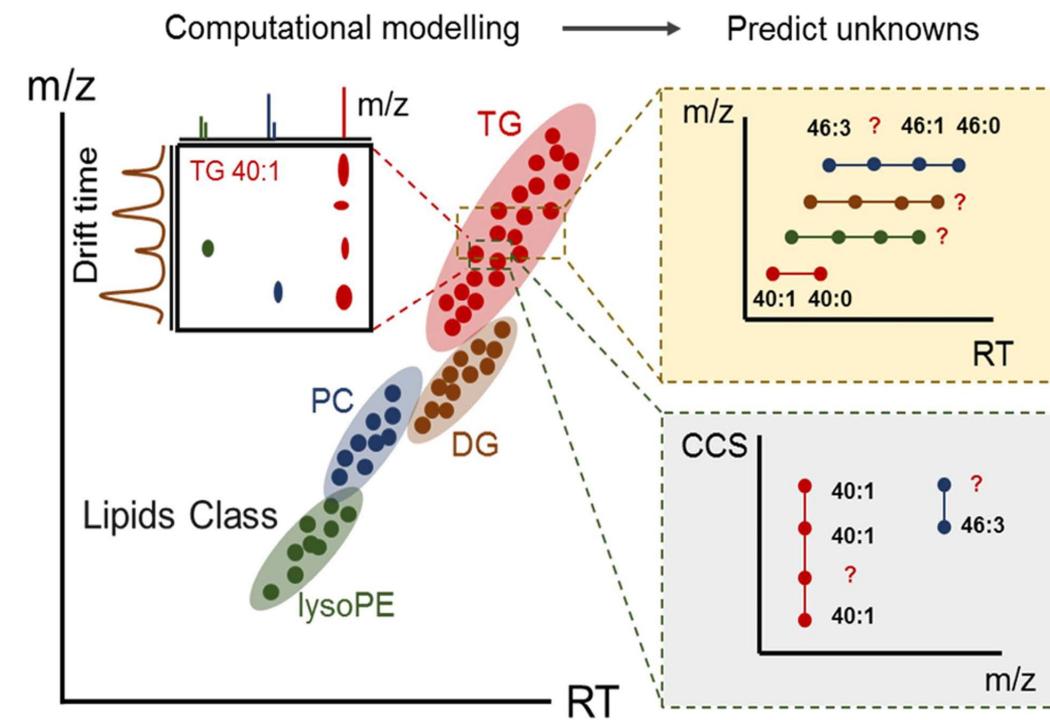

addition of 1 volume of
chloroform and 1 volume
of water, mixing and
filtering

biological sample
containing 80 % of
water:
e.g. blood, tissue
(homogenate),
microorganisms, cell
pellet

LC Drift Time Ion Mobility MS*

Imaging and datamatrix composition
